

ANDANTINO

Medicago sativa

- Top rated for lodging tolerance
- Very high yield of dry matter & protein
- Excellent Verticillium tolerance
- High Antrachnose tolerance

Combined high yield and protein content

Combining the very high dry matter yield per hectare with the high protein content maximises the energy and protein output per hectare. This is a "free" extra benefit compared to a standard variety.

Insuring that the yield can be conserved as hay or silage in good condition

The outstanding lodging tolerance of ANDANTINO ensures that the yield and the quality can be preserved.

Unstable weather conditions (rain..) are often postponing the harvesting process leading to a slower harvest, pollution with soil and a reduced or delayed regrowth.

Or you might simply have an overload of work, having to sow or prepare soil for other crops. Knowing that ANDANTINO will stand up for longer gives more flexibility and benefits.

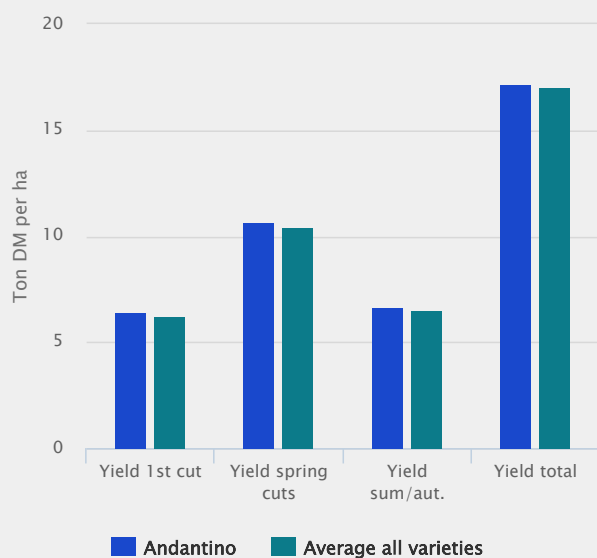

Technical Specifications

- Alfalfa/Lucerne
- Dormancy 4 with outstanding lodging tolerance: Saves the yield and quality!
- Listed/recommended in EU EST FR
