

# CARBERRY

*Festuca commutata*

- Eased management with balanced density
- Good disease tolerance = less input/impact
- Above average salt tolerance
- Adapted to close mowing too = versatile

## Reduced maintenance frequency

The good balance between density and performance makes CARBERRY very easy to manage and allows saving costs on input and working hours. All this is a big plus for sustainability too!

## Disease pressure and control

With fewer operations in the lawn the diseases spread less easily.

Combined with the genetic disease tolerance the overall need for fungicides is reduced and as a consequence lowering costs and environmental impact.

## Close mowing adaptation

CARBERRY obtains good scores for use on close mown areas (golf greens....), making it an allround choice.

All in all, CARBERRY is moderately drought-tolerant, and convinces you under low maintenance conditions. These facts nominate CARBERRY as an excellent partner for mixtures in the respect of half-shade or low input.

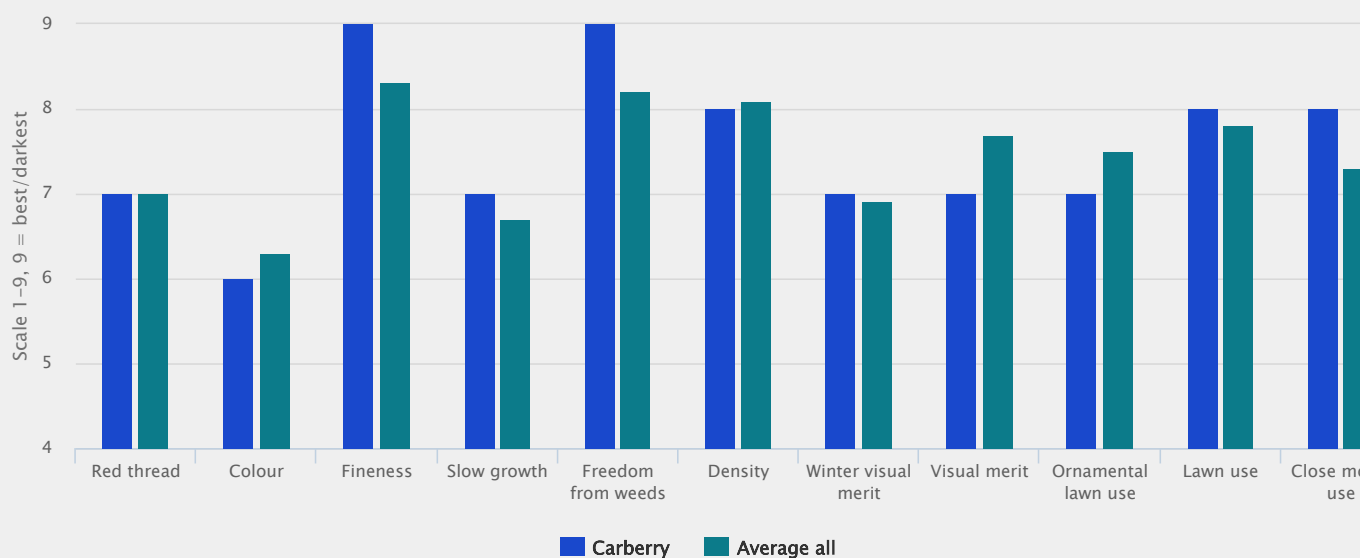

## Technical Specifications

- Chewings fescue
- Balanced density for eased management
- Listed/recommended in EU  
DE UK
