

CAREMO

Lolium westerwoldicum

- Two or more high yielding cuts
- Good mixing partner
- Excellent forage quality
- Ploidy: Tetraploid

Growth distribution

Caremo is a very fast growing grass but compared to most other tetraploid annual ryegrasses, the growth distribution is extended and not limited to a very big first cut.

Keep in control

With a high yield in the first two or more cuts the risk of getting overwhelmed by the production in Spring is limited and forage production secured.

Canopy height

Caremo does not grow as tall as other varieties making it suitable for mixtures with lower growing species and limiting risk of lodging. The lodging risk is also lowered by the larger yield distribution profile.

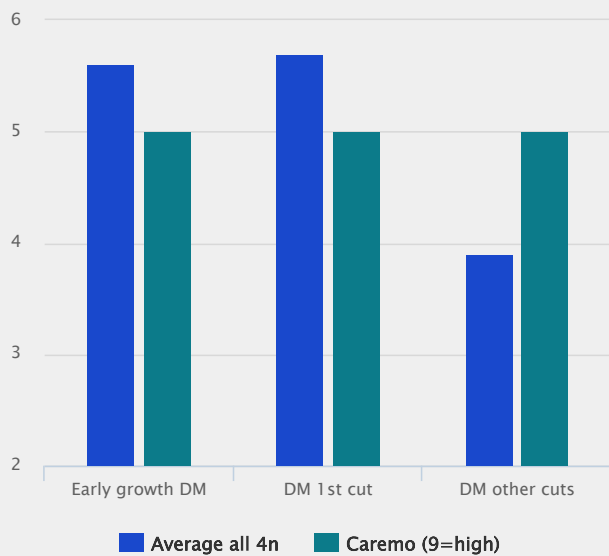

Technical Specifications

- Westerwold/annual ryegrass
- Annual ryegrass allowing several cuts
- Listed/recommended in EU NO
- Lateness: Intermediate
