

CHESTER

Poa pratensis

- With outstanding persistency
- Strong crop with a very even yield distribution
- Reliable and fast germination and establishment
- Variety ideal for mixtures

Really persistent and winter hardy

Chester is a very persistent and winter hardy variety which is immensely important for a permanent pasture.

Also vital for such kind of pastures is the ability to keep a dense sward. That is one of the central reasons to have smooth stalked meadow in a permanent mixture.

Chester proved in official trials that it give almost no room for weed infestation and helps to provide a nice and dense ground cover.

Good yield

Unlike many ryegrass varieties, the yield distribution of smooth stalked meadow grass is more even over a year's growing season.

Chester has an especially nice, even yield distribution on a very high level.

Resistant

The winter hardiness is good and Chester has also proved to have good resistance to rust and to other common diseases in smooth stalked meadow grass.

Technical Specifications

- Kentucky bluegrass
- Champion of persistency
- Listed/recommended in EU
DE RU

High yielding

BSA trials 2012-15 (Germany)

	DM yield relative of Total	DM 1st cut	DM Total - 1st cut
