

DASAS

Poa trivialis

- Fine overall impression
- High shade tolerance
- Good frost tolerance
- Erect growth habit

Growth Characteristics

Poa trivialis thrives under cool, humid and shady conditions. It is grown under many climatic conditions. It is normally used in mixtures with other species like Poa pratensis and red fescue.

Poa trivialis tolerates lower mowing heights than Poa pratensis because it is a bunch-growing grass (Poa pratensis is stoloniferous). This is used in overseeding of warmseason grasses in the dormant period.

Especially on golf greens Poa trivialis performs very well in the winter time under very low cutting heights.

Excellent for overseeding

DASAS has an erect growth habit which is a great advantage in overseeding of golf greens. It allows a low cutting height and a good straight ball run.

Technical Specifications

- Rough stalked meadow grass
- For Cool and Shady Conditions
- Listed/recommended in EU BA DK

Specification and ratings

Content of Poa trivialis in mixtures

Source: DASAS - the well-known safe choice!

Use of Dasas	Content in mixtures	Other components
Mixture for shady places	10-15%	Red fescue/hard fescue, Poa pratensis, perennial ryegrass
Mixture for overseeding of golf greens	10-20%	Perennial ryegrass
Mixture for winterfootball-pitches	20-30%	Perennial ryegrass
