

GLENCAR

Lolium perenne

- Exceptional early spring yield
- Unbeatable yield under conservation
- Massive first cut yield
- Huge total output

The Variety for Early Spring Yield

GLENCAR offers very high yield of early spring growth material for a late tetraploid. To prove the varieties adaptability, a first cut yield of 139% of controls was recorded in DARD trials in Ireland, exceptional performance by any standards.

The Variety for Silage

GLENCAR has unequalled yield under conservation regimes. Of particular interest is the fact that under NIAB trials, this yield advantage was maintained into the third harvest year, proving that GLENCAR is an essential ingredient in leys for long term.

The Variety for Grazing

GLENCAR has excellent spring production under grazing and very high annual grazing yields so should dual purpose performance be your aim, GLENCAR is the variety to use.

Technical Specifications

- Perennial ryegrass
- For Outstanding Yields Throughout the Year
- Listed/recommended in EU IE UK
- Lateness: Late
