

GRANDITTE

Festuca arundinacea

- Lateral growth with rhizomes
- High turf density and drought tolerance
- Top score for rust tolerance
- Excellent visual merit

Out of a prestigious family

GRANDITTE (Grande 3 in the US) is the latest variety of the famous series of rhizomatous tall fescues initiated with Grande and Grande II. It brings us to the level of the very best in terms of density and wear tolerance.

Ready for self-repair

The lateral aggressiveness and the capacity of producing rhizomes ensures better persistency and self-repair of bare spots. After a new sowing in difficult conditions, it will also help compensate for a low plant density.

Disease tolerance

GRANDITTE has superb rust tolerance with the maximum score of 9 in French official trials. Altogether to obtain a healthy attractive lawn, as it also has good tolerance to *Microdochium*, red thread and leaf spot.

Use

GRANDITTE will perform in sport turf fields as well as home lawns and public parks, where the high drought tolerance and spreading abilities will be appreciated.

Technical Specifications

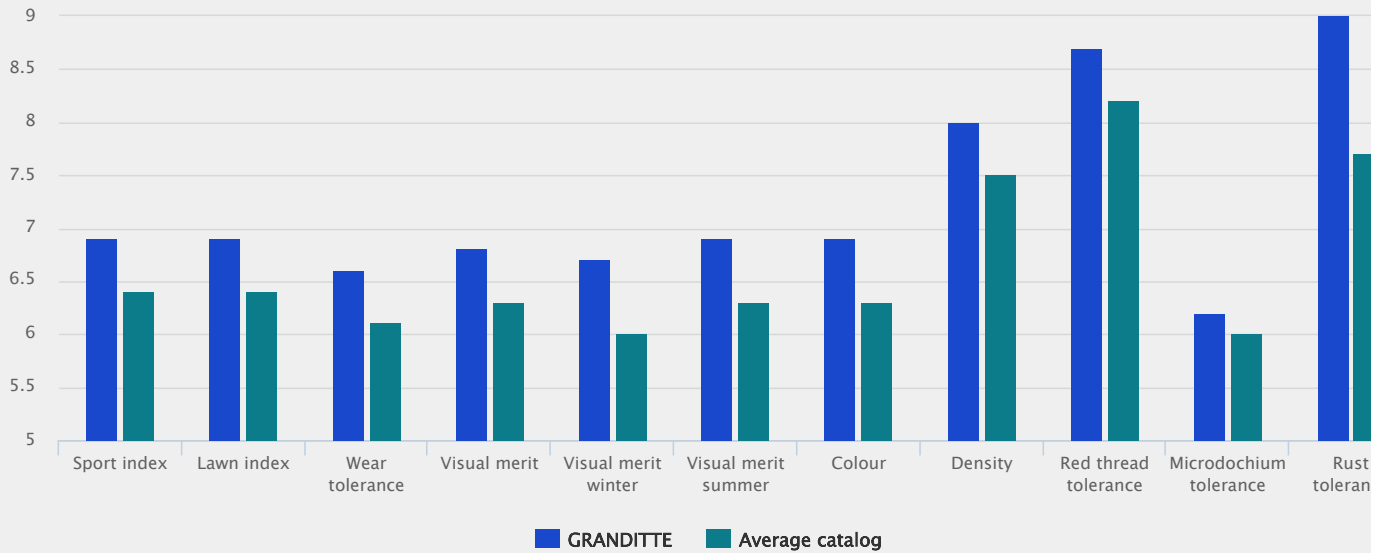

- Tall fescue
- Finally a top-rated variety with excellent lateral growth!
- Listed/recommended in EU
