

GRASSMAX ORIGINAL

ForageMax

- Boosts output
- Coated with [ProNitro®](#)
- Fast establishment
- - and tasty!

GrassMax - Original and +[ProNitro®](#)

Maximise your output with GrassMax by overseeding existing fields

Fast germinating species provides intensive establishment of renewed grass sward. The mixture is recommended for improvement of old or winter damaged grass fields when re-sowing is not reasonable, e.g. when there is enough clover but too little grass, or when there is not enough time for reseeding.

The output of an older sward can be increased dramatically by introducing new vigorous young plants. GrassMax uses only very quick establishing species like festulolium, hybrid ryegrass and tetraploid perennial ryegrass.

These species have big seeds and fast germination that enable competition with existing plants in the field. We recommend overseeding fields that are not completely renewed on a regular basis. GrassMax - Original is also offered with [ProNitro®](#), a unique seed coating with nitrogen starting fertiliser. [ProNitro®](#) coating provides germinating seeds with essential nutrient during establishment and helps sustain a vigorous sward during the whole season.

GrassMax Original seeding rate, KG/HA: 15-30

GrassMax [ProNitro®](#) seeding rate, KG/HA 30-60
