

LOLAN

Lolium westerwoldicum

- "Italian - Annual" type
- Number one in yield
- Rather late heading = quality in spring
- Tetraploid

Intermediate behaviour

LOLAN is a very particular variety being intermediate between typical annual types and Italians types. This shows as much higher leaf/stem ratio than annuals and much faster growth than Italians.

The versatile choice

The particular type combining speed of growth, yield and quality makes LOLAN the ideal choice when there is doubt about the optimal solution. And as both conservation and grazing is possible - LOLAN is a safe choice.

Heading like an Italian

Heading takes place at the time of most Italians or even a little later. This leaves a very long period with leafy quality grass in the spring.

Technical Specifications

- Westerwold/annual ryegrass
- The bridge between annuals and Italians
- Listed/recommended in EU
CZ LU RU TR UK
- Lateness: Intermediate
