

MAURICE

Lolium perenne

- Very high flexibility
- Very best quality
- extremely dense - as a diploid
- High disease resistance

Perfect for Grazing

MAURICE is very late heading, disease resistant, persistent variety, offering high yields and well suited to extensive management regimes using low fertiliser inputs.

Ground Cover and Persistence

MAURICE has an exceptionally high ground cover rating for a tetraploid variety. This leads to a very dense sward with the added benefits of good winter hardiness and high sugar content for enhanced palatability. MAURICE produces very few stems so forage quality and palatability remains high even in summer.

Disease Resistance

MAURICE has exceptionally good resistance to all grass diseases. This means that feed value is not crucial for varieties used in extensive or low input management systems.

Technical Specifications

- Perennial ryegrass
- The Variety with Staying Power!
- Listed/recommended in EU DK UK
- Lateness: Late

*** This is the minimum benefit over the three varieties**

Results from NIAB UK trials – control variety Fennema. Ratings 1-9, 9 is best
