

SENU PAJBJERG

Festuca pratensis

- Good winter hardiness
- Good persistence
- High stress tolerance
- Active growth under low temperatures

Good winter hardiness

Meadow fescue is a perennial and persistent grass specie.

It does not require high temperatures for active growth and is very winter-hardy.

It appreciates high soil moisture content.

Meadow fescue can be grown successfully on both ordinary arable land and in fertile humus-rich soils.

It is, however, not suitable for poor, dry and sandy soils.

Meadow fescue has an early spring growth with a regrowth consisting mainly of leafy shoots and is good for both cutting and grazing.

SENU has a medium early growth in spring and medium early heading.

SENU is suitable for meadow mixtures used for mowing or combined mowing and grazing.

SENU is winterhardy with a good persistence.
