

SEZINA

Lolium multiflorum

- High dry matter yield in spring as in summer/autumn
- Excellent tolerance to rusts
- Very good leaf spot (*Drechslera* sp.) tolerance
- Mainly leafy regrowth for better quality and palatability

Yield distribution

Italian ryegrass is appreciated for the early high yield in the spring, allowing to secure a big part of the annual production in case of drought. SEZINA expresses this advantage very well but also ranks high for the summer/autumn yield. The regrowth after each cut is rather leafy, for better palatability and quality, without compromising the ease of conservation as silage or hay.

Healthy plants for vitality and quality

SEZINA expresses high tolerance to the two most frequently damaging diseases: Attacks of rust can be very harmful to yield, palatability and persistency. It is mainly in the summer & autumn periods. Attacks of leaf spot (*Drechslera* sp.) is present right from the spring where the main part of the annual yield is building up, so the impact can be much higher than what it seems visually.

Variety type

SEZINA is tetraploid (4n), synonym of high yield, palatability and good disease tolerance. As a true Italian ryegrass, it will last 18-24 months depending mainly on the severeness of summer drought.

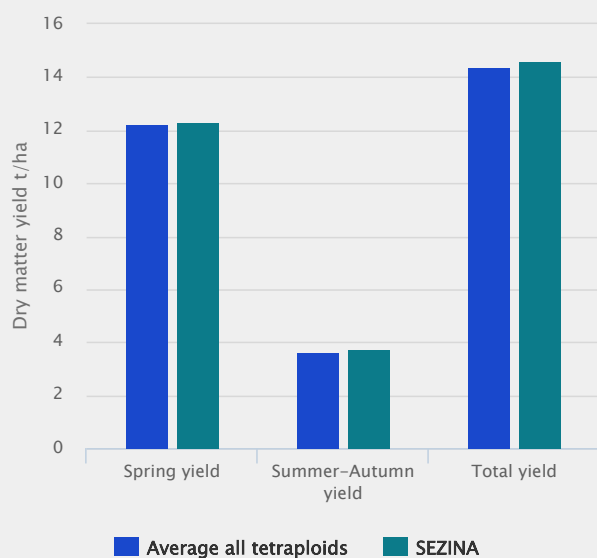

Technical Specifications

- Italian ryegrass
- Top yielding right from the spring & excellent disease tolerance
- Listed/recommended in EU
