

SIRIVER MKII

Medicago sativa

- Very high yielding growing year round
- Fall dormancy 9
- Early start in spring allowing 7-9 cuts/year
- Deep rooted, producing during dry spells
- Tolerance to pests and diseases

Non-dormant type = winter active

With a fall dormancy of 9, SIRIVER MKII grows year round, also late autumn through winter in mild conditions allowing 7-9 cuts/year. The strong crown provides grazing tolerance.

Origin and improvements

SIRIVER MKII is a result of several cycles of recurrent selection for disease and pest resistance and agronomic performance within the cultivar Siriver. The forage yield is increased considerably compared to SIRIVER and CUF101. Without irrigation/dry conditions, SIRIVER MKII shows higher forage yields.

Productive for several years

High seedling vigour for fast establishment. And increased persistency compared to SIRIVER.

Sown at 20-25 kg/ha, SIRIVER MKII will produce through 3-5 years after sowing.

Technical Specifications

- Alfalfa/Lucerne
- Very high forage production. Fall dormancy 9 allowing 7-9 cuts/year
- Listed/recommended in IT
