

SPECTRE

Lolium perenne

- High total dry matter production
- Exceptionally high first cut
- High digestibility in first cut
- Remarkable digestibility in second cut
- Highly recommended for forage production

Outstanding high first cut

Spectre is a top-ranked tetraploid late perennial ryegrass that is destined to change the game in high-quality forage production. With top-notch traits, Spectre is highly recommended for those who are looking for maximum yield and quality of forage in first cuts.

Improved quality and dry matter yield in one go

With a high total dry matter production of high digestibility, Spectre guarantees an impressive quantity of fodder. Moreover, Spectre excels in its exceptional high first cut, which is an extraordinary feature for a late perennial forage ryegrass. The first harvest yields the highest possible amount of highly digestible forage, making it the perfect choice for farmers who want to optimize their milk or meat production.

Spectre is on its way to be listed in the UK, where it has already proven to have an extremely high dry matter in the first cut, with high digestibility. What's more, Spectre boasts an outstandingly high digestibility in the second cut.

Overall, Spectre is a fantastic variety for farmers everywhere who want to achieve maximum yield and quality of forage.

Technical Specifications

- Perennial ryegrass
