

# TAPPIANA

*Lolium perenne*

- Early start in spring with large spring window
- Excellent rust tolerance
- Late heading type, producing before summer drought
- Versatile for grazing and cutting

## Large spring window

With almost 64 days from spring growth start to heading, TAPPIANA leaves a large window in the spring to obtain quality forage whether exploited for conservation or grazing.

The early start also leads to a total high yield of the spring and early summer cuts, ensuring a high production before eventual summer drought compromises the growth for the rest of the season.

## Excellent disease tolerance

With a score of 7,7 TAPPIANA is one of the most rust tolerant varieties in the range of tetraploids heading from 3 days before to 3 days after TAPPIANA. The good tolerance to leaf spot and various diseases allows high palatability and forage quality throughout the season.

## Technical Specifications

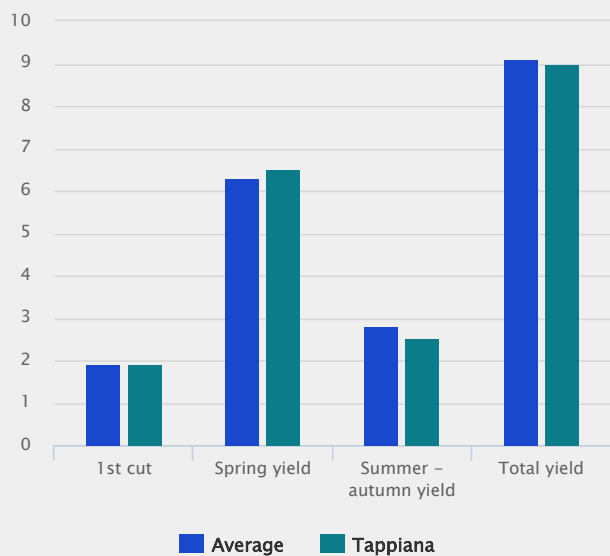

- Perennial ryegrass
- Large spring window and excellent rust tolerance
- Listed/recommended in EU FR
- Tetraploid perennial ryegrass

## Specification and ratings

### Dry matter yield

Source: *herbe-book.org* June 2019

Scale: Ton dry matter per hectare compared to average of varieties heading 3 days before/after

### Disease tolerance

Source: *herbe-book.org* June 2019

Scale: 1-9, 9=best
