

# TETRAGREEN

Lolium perenne

- Improved stress tolerance
- Ideal mixture partner (overseeding...)
- Allround disease resistance
- 4n = Big seed = better establishment

## 4salt

### Superior characteristics

Tetraploids have long been known to show better stress and disease tolerance compared to diploids. Now these advantages are also available in a turf grass variety: TETRAGREEN.

### Disease resistance

Improved disease resistance is observed for rusts, snow mould, Drechslera leag spot and red thread.

### Perfect mixture partner

As Tetragreen is less dense than diploids it makes it easier for *Poa pratensis* to establish. When combined with diploid perennial ryegrass a perfect overseeding mix is obtained. In mixtures with tall fescue the larger leaves of Tetragreen compared to diploids leads to a more homogeneous aspect.

### Seed size and vigour

Seed of Tetragreen is at least 1,5 times heavier than diploid seed. It makes it easy to seed and provides stronger seedlings with faster establishment; Another argument for using Tetragreen in overseeding mixtures.

### Improved salt tolerance

TETRAGREEN has better salt tolerance than most diploids. Have TETRAGREEN in mind when establishing new turf areas!

## Technical Specifications

- Perennial ryegrass
- Mixture partner for better disease and stress tolerance
- Listed/recommended in EU  
BY DE IT RU TR UK

## Relative scores for drought tolerance

### DLF trial sites in Les Alleuds and Carpentras (France)

Variety	Les Alleuds (Loire region)	Carpentras (South of France)
Diploid Lp (mean of 3 varieties)	100	-
Diploid Lp (mean of 6 varieties)	-	100
4TURF (mean of 3 varieties)	133	119

### Ratings

Scale 1-9, where 9 = best or most pronounced
