ForageMax

## GRASSMAX SUPER DRY

Quick and tasty

- For overseeding
- Quick establishment
- Improves output of existing sward
- Heat and drought resistant

### Ratings

#### Intensive Pasture

#### High Yield

#### High Protein

#### Fast Germination

#### Wear Resistant

### GrassMax Super Dry

Maximise your output with GrassMax Super Dry by overseeding existing fields

The output of an older sward can be increased dramatically by introducing new vigorous young plants. GrassMax Super Dry uses only very quick establishing species like Festulolium, Hybrid ryegrass and Tetraploid Perennial ryegrass.

Species included in the mixture have fast germination and also good heat and drought resistance. These species would be recommended for improvement of grass fields under dry conditions. These species have big seeds and fast germination that enable competition with existing plants in the field. We recommend overseeding fields that are not completely renewed on a regular basis.

Seeding rate, KG/HA: 15-30

### GrassMax Super Dry

#### Mixture Composition

Hybrid Ryegrass	40 %
Perennial Ryegrass Intermediate Tetraploid	40 %
Tall Fescue	20 %
