

BANGOR

Beta vulgaris

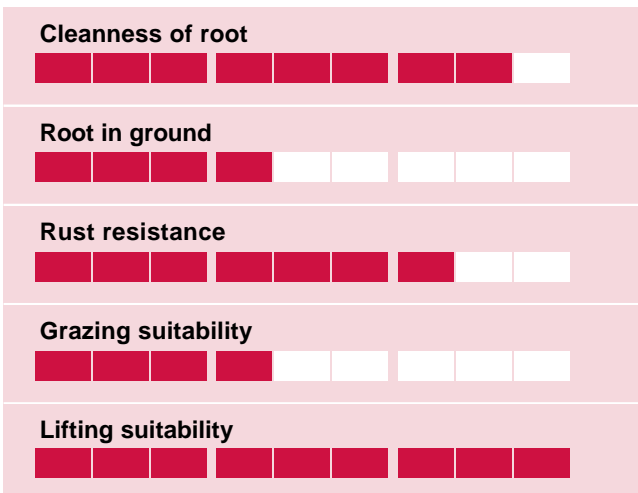

Fodder beet

Beet for forage - Yellow, smooth skin and high yield

- 10 % higher yield than Kyros
- Smooth with exceptionally low dirt tare
- Most of the root above ground
- Yellow root with 17-18 % drymatter

Ratings

The modern type fodder beet

Bangor is an improvement of the illustrious/long-time-acknowledged varieties Kyros and Troya – resulting in 10% yield increase and uniform root.

Easy to harvest

The lifting of Bangor is eased on all soil types, by the uniform and high position above ground.

Smooth root

The root of Bangor is smooth with a shallow root. This is the reason for the very low dirt tare. The low content of soil in the pile or silage results in forage of very high quality.

More than 20 ton drymatter

In trials, Bangor has delivered almost 21 tons of drymatter per ha in root alone. Additionally 4-5 ton DM can be expected in the top.

Performance and features

Source: Results from 'Landsforsøg' (Denmark) 2010-11 * Score from 1 to 4. 4 = very smooth

	% Drymatter in root	Smoothness of root*	% Dirt	% Above ground	Yield drymatter pr. ha	Relative drymatter yield
Bangor	17,7	3	3,3	80	20,7	105
Magnum	19,2	2,8	3,7	76	19,23	100
