Ratings

High yields right from the spring cuts

Summer autumn yields are often affected by drought, so it is important to recover as much dry matter as possible from the spring cuts to secure the forage supply.

High yield for 18-24 months

The main reason of growing Italian ryegrass is to obtain very high yields of dry matter, not only in 1-4 cuts, but for 18-24 months. With a score of 7.5 on a 1-9 scale, UDINE confirms excellent persistency.

Quality parameters:

The forage is very healthy due to the excellent resistance to rust and the low aftermath heading.

**UDINE confirms the excellent yield capacity in several countries official and recommended lists:
France, UK and Germany.**
