

Festulolium

Hipast = resistance + persistency + digestibility + yield

- High digestibility
- Increasing yield
- Persistency
- Drought tolerance
- Resistant to diseases

Ratings

Festulolium – tall fescue type

Hipast is a persistent festulolium forage grass and with its comprehensive ground cover, density and softness it will suit grazing and silage making.

Resistant and persistent

With its high resistance to rust, snow mold and helminthosporium, Hipast has distanced itself from other festuloliums and will not only suit cold areas with its high winter hardiness but also suit excellent in warm, humid areas afflicted by drought periods and diseases.

Yield and forage quality

Hipast is a late festulolium and it delivers fast regrowth and increasing yield year after year. It will not only deliver an exceptional high yield but one of the qualities which Hipast possesses, is the high content of digestible matter in combination with a high-energy content.

Official trials reveals a high energy content of average 6.0 NEL20 MJ per kg. dry matter with a protein content up to 12.6 hkg per hectare.

Hipast: Excellent yield and good feeding value

Trials 2010-13 Danish Agricultural Advisory Service

	NEL per ha, 1st year	NEL per ha, 2nd year	NEL per ha, 3rd year
Hipast	118,7	122	110,8
Perennial ryegrass	117,6	98,4	51,3
